

1) I open the Nexus UI :

2) I click on browse

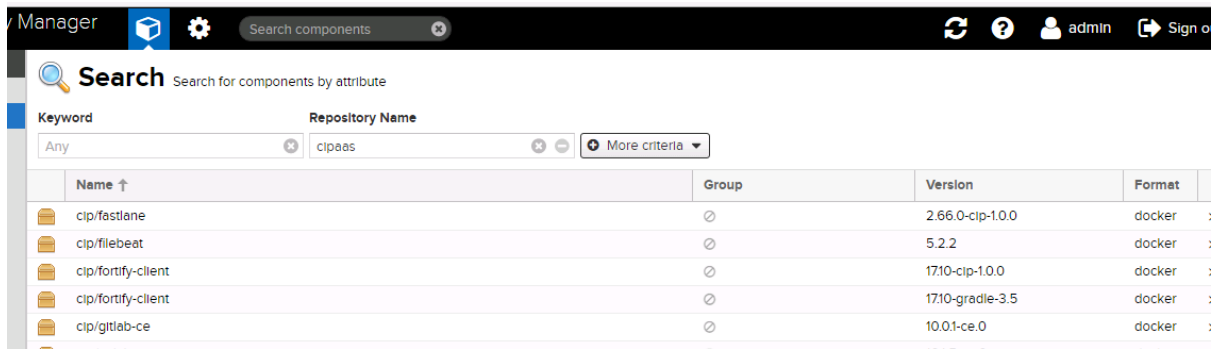

3) I click on the “cipaas” hosted docker repo

I see there an asset “alpine/manifest/...”

And also the “blobs” assets

4) I click on advanced search (on the right of the screen) and I select “cipaas” as repository:

And there I see only the assets “cip/\*” which basically represent the docker images I’ve got in the “cipaas” repo

**So my point is that I would like to have the same content rendered by the tree view as I’ve got via the “advanced search”**
